

How does it work?

Laser energy is used to target and destroy hair follicles responsible for hair growth without harming surrounding tissue, so there's minimal risk.

What areas can be treated?

Permanent laser hair reduction can remove hair from faces (except around the eyes), backs, chests, arms, underarms, bikini lines and legs.

How many treatments will I need

Laser hair removal technology can only affect hair in active phases of growth. As not all hair are in this phase at the same time, several sessions are necessary. The number and duration of treatments depends on the intensity of the hair growth and body region. For a good and long lasting result, 5-8 sessions are usually needed. In addition, we recommend a maintenance treatment every 12 months.

Can all skin and hair types be treated?

The laser system is set to your hair color, your skin type and hair structure and is basically suitable for almost all hair types and hair colors. Light, thin hair (fluff) requires more treatment as dark, thick hair. White hair is not suitable for laser epilation.

How does the treatment feel like?

The treatment is easily tolerated by most patients. Most people feel only a slight, momentary "snap" and a sensation of heat at the treatment site during the procedure. An important point is the individually different pain. Thus the verdicts after the treatments range from "I hardly felt anything" to "it hurted a bit". Thanks to the advanced cooling system of the laser Vectus these perceptions are reduced to a minimum. In sensitive patients, better compatibility can be achieved by pre-cooling the treatment area.

Are there any side effects?

Basically, the side effects are very rare. A mild redness or local minor swelling may occur at the treated areas. This irritation usually disappears within a few hours. Thanks to modern technology, the risks are reduced to a minimum. Ask your provider to discuss other possible side effects and the necessary post-treatment care with you.

How quickly will I recover?

You can resume regular daily activities immediately following treatment.

What should I do before / after laser hair removal?

It is important that you don't pluck or epilate the hair four weeks prior to treatment. Otherwise, the laser therapy is not effective. You are not allowed to take photosensitizing medications (including St. John's wort). You should shave the hairy area in the morning before laser treatment. For an optimal treatment outcome, it is important that you protect the area to be treated consistently to UV light four weeks before and after the treatment. We recommend not to apply any make-up in face or deodorant in the underarm area.

When should no hair removal be carried out by laser?

Taking photosensitizing medications, severe circulatory disorders and in pregnancy. With fresh tanning laser treatment must be moved in order to avoid side effects.
